                                                                                                                                                                 AAQ81104 is a peptide nucleic acid (PNA), which binds a target sequence. The binding of the PNA prevents the transcription of the target sequence by RNA polymerase. The ability of the PNA to arrest transcription makes it useful in gene therapy, and in diagnostic and prophylatic methods. (Updated on 25-WAR-2003 to correct PN field.)

ö
AAQ81099 and AAQ81100 are peptide nucleic acids (PNAs), which bind the target sequences described in AAQ81101-Q81104. The binding of the PNAs prevents the transcription of the target sequences by the RNA polymerases T3 and T7. The ability of the PNAs to arrest transcription makes them useful in gene therapy, and in diagnostic and prophylatic methods. (Updated on 25-MAR-2003 to correct PN field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          AAQ81121 is a peptide nucleic acid (PNA), which binds a target sequence. The binding of the PNA prevents the transcription of the target sequence by RNA polymerase. The ability of the PNA to arrest transcription makes it useful in gene therapy, and in diagnostic and prophylatic methods. (Updated on 25-WAR-2003 to correct PN field.)

Attenuation of pathogenic HIV-1 strain NI4-3 involves deletion of 1 or more decanucleotides (AAQ96406-Q97018) from the nef gene and/or 1 or more decanucleotides (AAQ96406-Q97018) from the LTR region; the sequence of AAQ96406 corresponds to nucleotides 1-10 of the nef gene (AAQ96141). The response in humans, and enable the generation of therapentic, diagnostic and targeting agents against HIV-1 infection. (Updated on 16-OCT-2003 to standardise OS field)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   New non-pathogenic HIV-1 strain carrying a deletion in its nef gene
LTR region - can be used in a vaccine to inhibit/reduce productive
infection in an individual by a pathogenic strain.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               more decanucleotides (AAQQ406-Q9018) from the nef gene and/or 1 or more decanucleotides (AAQQ9019-Q97018) from the nef gene and/or 1 or more decanucleotides (AAQQ97019-Q97016) from the LTR region; the sequence of AAQQ6406 corresponds to nucleotides 1-10 of the nef gene (AAQ96141). The resulting avirulent HIV strains are still capable of inducing an immune response in humans, and enable the generation of therapeutic, diagnostic and targeting agents against HIV-1 infection. (Updated on 16-OCT-2003 to standardise OS field)

contiguous nucleating expression where the passes at least 1 to contiguous and the fact of the passes and NORF genes are given in AAV50051 to tags for highly expressed genes and NORF genes are given in AAV50051 to AAV50345. The present invention describes: (1) a method of using yeast genes to modulate the cell cycle which comprises administering to a cell on isolated bNA molecule comprising a yeast gene which is involved in an isolated bNA molecule comprises contacting a test substance with a yeast tags given in AAV50051 to AAV50345); (2) a method for screening candidate antifumgal drugs which comprises contacting a test substance with a yeast cell and monitoring expression of a yeast gene which is involved in cell cycle progression; (3) a method of identifying human genes which are comprising at least 10 contiguous which comprises of a yeast gene which is differentially expressed between at least 2 phases selected from the log comprising at the cell cycle, where the probe comprises at least 14 the phase in the cell cycle, where the probe comprises at least 14 contiguous nucleotides of a NORF gene (SAGE tags given in AAV50051 to antiguous nucleotides of a NORF gene (SAGE tags given in AAV50051 to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  New peptide nucleic acid compound(s) containing 1-8Calkyl:amine side chains - have improved solubility and show enhanced sequence specificity and binding affinity for complementary DNA or RNA.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Peptide nucleic acid, DNA, aminoethyl-glysine backbone, effector liga

cc enhanced solubility, sequence specificity and binding affinity for complementary DNA or RNA, due to incorporation of the 1-8C alkylamine side chain. The PNAS described above may be linked to low molecular consists of the constant of transcription factors or antibodies), water-(in) soluble polymers, cranscription factors or antibodies), water-(in) soluble polymers, coligonucleotides or carbohydrates. The PNAS may be used in gene condulation, diagnostic purposes, biotechnology or other research couples with double stranded DNA (and may thus be used in treatment of cancer, ALDS, other viral infections or genetic disorders). Note:

Sequences AAV11225-V11237 are not described within the specification but are given in the sequence listing. (Updated on 17-OCT-2003 to standardise constants).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Peptide nucleic acid; PNA; aminoethyl-glysine backbone; effector ligand; aminoethyl-lysine; 1-8C alkylamine side chain; gene modulation; diagnostic; triple helix; treatment; infection; genetic disorder; 88.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           New peptide nucleic acid compound(s) containing 1-8Calkyl:amine side chains - have improved solubility and show enhanced sequence specificity and binding affinity for complementary DNA or RNA.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          This invention describes peptide nucleic acids (PNAs) which exhibit enhanced solubility, sequence specificity and binding affinity for complementary DNA or RNA, due to incorpozation of the 1-8C alkylamine side chain. The PNAs described above may be linked to low molecular weight effector ligands (e.g. reporter ligands such as fluorescent
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Gaps

ö
ligands), peptides/proteins with signalling activity (e.g. enzymes, transcription factors or antibodies), water-(in)soluble polymers, oligomucleotides or carbohydrates. The PNAs may be used in gene modulation, diagnostic purposes, biotechnology or other research purposes. They may be modified in such a way that they form triple helices with double stranded DNA (and may thus be used in treatment of cancer, AIDS, other viral infections or genetic disorders). Note: Sequences AAV11225-V11237 are not described within the specification but are given in the sequence listing. (Updated on 17-OCT-2003 to standardise OS field)

expression) tags used to identify mRNA transcripts encoding capression) tags used to identify mRNA transcripts encoding capressed in monocyte-derived dendritic cells compared infunnostimulatory cofactor proteins which are preferentially or differentially expressed in monocyte-derived dendritic cells compared (expressed sequence tags) which were previously unknown genes or ESTs (expressed sequence tags) which were previously unknown to be preferentially or differentially expressed in dendritic cells, while correspond to novel genes. Antigen-presenting cell cher transcripts correspond to novel genes. Antigen-presenting cell cher transcripts correspond to novel genes. Antigen-presenting cell chertical and subsequent recognition by T-cell receptors is alone activate a robust cytotoxic immune response that can lyse clissificient to activate a robust cytotoxic immune response that can lyse trumour cells, immunostimulatory cofactors also being required for the tumour cells, immunostimulatory cofactors also being required for efficient activation of cytotoxic T-lymphocytes (CTLS). Nucleic acid sequences identified using the SAGE tags have several potential uses.

They may be used in vaccines to induce an immune response, particularly against a tumour antigen; to modulate the genotype of an APC; to screen for agents that modulate expression of differential uses.

They may be used in vaccines to conduct on primers for the any pression of their encoded proteins, can be used to identify expression of the dendritic cell differentially expressed genes, or of their encoded proteins, can be used in active immunotherapy (or to stimulate production of a coll seabcinging to the monocyte lineage. Cells containing these genes can be used in active immunotherapy (or to stimulate production of a presentation of endogenous APCs and upregulates the APCs for the presentation of coefficients and upregulates the APCs for the presentation of coefficients and secretion of reall growth factors ensures adequate antigen presented on the immune
                                                                                                                                                                                                                                             Isolated polynucleotides differentially expressed in antigen-presenting cells, useful in gene vaccines against cancer.
                                                                                                                                                                                                                                                                                                                                Claim 1; Page 82; 130pp; English.

ö
by standard immunoassays or hybridisation/amplification reactions. Compounds that modulate expression of the transcripts are potentially useful for treatment of (metastatic) breast cancer, while promoters from the transcripts are used to direct expression, in selected cell types, of e.g. therapeutic genes (also ribozymes or antisense sequences), particularly an antigen-encoding sequence for use in gene or cell-based vaccines; Polypeptides encoded by the transcripts are also useful in antibodies (Ab). Ab are used to detect the polypeptides or as therapeutic agents. Host cells that produce the polypeptides or as therapeutic agents. Host cells that produce the polypeptides can be used to expand and isolate populations of educated, antigen-specific immune effecter immunotherapy
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             AA280767 to AAZ83941 represent tags corresponding to distinct transcripts that are preferentially transcribed in the metastatic breast tumour tissue (i.e. are upregulated in metastatic breast tumour cells). AAZ83942 to AAZ86677 represent tags corresponding to distinct transcribts that are preferentially transcribed in the primary or non-metastatic breast tumour tissue (i.e. are downregulated in metastatic breast tumour cells). These

tiesue (i.e. are upregulated in metastatic breast tumour cells). AAZ83942

CO AAZ86677 represent tags corresponding to distinct transcripts that are
preferentially transcribed in the primary or non-metastatic breast tumour
clissue (i.e. are downregulated in metastatic breast tumour cells). These
transcripts can be used for diagnosis, prognosis, monitoring and
creatment of breast cancer, particularly where metastatic Diagnosis is
by standard immunoassays or hybridiation/amplification reactions.
Compounds that modulate expression of the transcripts are potentially

ct that are preferentially transcribed in the metastatic breast tumour tissue (i.e. are upregulated in metastatic breast tumour cells). AA28677 represent tags corresponding to distinct transcribts that are preferentially transcribed in metastatic breast tumour cells). AA28677 represent tags corresponding to distinct transcribts that are preferentially transcribed in the primary or non-metastatic breast tumour tissue (i.e. are downregulated in metastatic breast tumour cells). These transcribts can be used for diagnosis, prognosis, monitoring and transcribts can be used for diagnosis, prognosis, monitoring and transcribts can be used for hybridisation/amplification reactions. Compounds that modulate expression of the transcripts are potentially useful for treatment of (metastatic) breast cancer, while promoters from the transcripts are used to direct expression, in selected cell types, of e.g. therapeutic genes (also ribozymes or antisense sequences), particularly an antigen-encoding sequence for use in gene or cell-based vaccines, Polypeptides encoded by the transcripts are also useful in vaccines, for diagnosing breast cancer and for raising specific antibodies (ab). Ab are used to detect the polypeptides or as therapeutic and isolate populations of educated, antigen-specific immune effecter cells.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Isolated polynucleotides differentially expressed between metastatic and non-metastatic breast cancer cells, useful for diagnosis, prevention and treatment of cancer.

that are preferentially transcribed in the metastatic breast tumour that are preferentially transcribed in the metastatic breast tumour cissum (i.e. are upregulated in metastatic breast tumour tissue (i.e. are upregulated in metastatic breast tumour cells). AA283942 ct chastoffy represent tags corresponding to distinct transcribts that are preferentially transcribed in the primary or non-metastatic breast tumour cissue (i.e. are downregulated in metastatic breast tumour crissue (i.e. are downregulated in metastatic breast tumour cells). These transcripts can be used for diagnosis, prognosis, monitoring and transcripts are metastatic. Diagnosis is by standard immunoassays or hybridisation/amplification reactions.

Compounds that modulate expression of the transcripts are potentially useful for treatment of (metastatic) breast cancer, while promoters from the transcripts are used to direct expression, in selected cell types, of e.g. therapeutic genes (also ribozymes or antisense sequences), construinarly an antigen-encoding sequence for use in gene or cell-based vaccines; for diagnosing breast cancer and for raising specific antibodies (Ab). Ab are used to detect the polypeptides or as therapeutic and isolate populations of educated, antigen-specific immune effecter cells, e.g. cytotoxic T lymphocytes, and these used for adoptive

AAZ80767 to AAZ83941 represent tags corresponding to distinct transcripts that are preferentially transcribed in the metastatic breast tumour tissue (i.e. are upregulated in metastatic breast tumour cells). AAZ83942 to AAZ86677 represent tags corresponding to distinct transcripts that are preferentially transcribed in the primary or non-metastatic breast tumour tissue (i.e. are downregulated in metastatic breast tumour cells). These transcripts can be used for diagnosis, prognosis, monitoring and transcripts can be used for diagnosis, prognosis, monitoring and transcripts can be used for hybridisation/amplification reactions. Occambounds that modulate expression of the transcripts are potentially compounds that modulate expression of the transcripts are potentially useful for treatment of (metastatic) breast cancer, while promoters from the transcripts are used to direct expression, in selected cell types, of e.g. therapeutic genes (also ribozymes or antisense sequences), particularly an antisen-encoding sequence for use in gene or cell-based vaccines, for diagnosing breast cancer and for raising specific antibodies (Ab). Ab are used to detect the polypeptides or as therapeutic and isolate populations of educated, antisense used to expand and isolate populations of educated, antisense used for adoptive
Isolated polynucleotides differentially expressed between metastatic and non-metastatic breast cancer cells, useful for diagnosis, prevention and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Gaps

that are preferentially transcribed in the metastatic breast tumour cells). AAZ80767 to AAZ80767 to AAZ80741 represent tags corresponding to distinct transcripts that are the upregulated in metastatic breast tumour cells). AAZ803942 to AAZ86677 represent tags corresponding to distinct transcripts that are preferentially transcribed in the primary or non-metastatic breast tumour cells). These tissue (i.e. are downrequlated in metastatic breast tumour cells). These transcripts can be used for diagnosis, prognosis, monitoring and treatment of breast cancer, particularly where metastatic. Diagnosis is by standard immunoassays or hybridisation/amplification reactions.

Compounds that modulate expression of the transcripts are potentially useful for treatment of (metastatic) breast cancer, while promoters from the transcripts are used to direct expression, in selected cell types, of e.g. therapeutic genes (also riboxymes or antisense sequences), particularly an antigen-encoding sequence for use in gene or cell-based vaccines, for diagnosing breast cancer and for raising specific vaccines, for diagnosing breast cancer and for raising specific antibodies (Ab). Ab are used to detect the polypeptides or as therapeutic and isolate populations of educated, antigen-specific immune effecter cells, the transcripts are used to expand and isolate populations of educated, antigen-specific immune effecter cells, immine because the polypeptides can be used to adoptive immine because the cells of adoptive cells, and these used for adoptive
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ö
                                   Isolated polynucleotides differentially expressed between metastatic and non-metastatic breast cancer cells, useful for diagnosis, prevention and

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         g
                                                                                                                                                                          AAZ80767 to AAZ83941 represent tags corresponding to distinct transcripts that are preferentially transcribed in the metastatic breast tumour cells). AAZ883442 tissue (i.e. are upregulated in metastatic breast tumour cells). AAZ883942 coresponding to distinct transcripts that are preferentially transcribed in the primary or non-metastatic breast tumour cells). These tissue (i.e. are downregulated in metastatic breast tumour cells). These transcripts can be used for diagnosis, prognosis, monitoring and transcripts can be used for diagnosis, prognosis, monitoring and compounds that modulate expression of the transcripts are potentially compounds that modulate expression of the transcripts are potentially cosful for treatment of (metastatic) breast cancer, while promoters from the transcripts are used to direct expression, in selected cell types, of particularly an antigen-encoding sequence for use in gene or cell-based vaccines; for diagnosing breast cancer and for raising specific antibodies (Ab). Ab are used to detect the polypeptides can be used to expand cand isolate populations of educated, antigen-specific immune effecter cells, e.g. cytotoxic T lymphocytes, and these used for adoptive immunotherapy

The present invention describes a method of identifying the type of cell in a sample, involving determining which of the sequences AAM513161.

AAM54724 is expressed by the cell. The transcriptomes described in the invention are cell-type specific, cancer specific or ubiquitously expressed in humans. They can also be used to screen for drugs, reduce cancer specific gene expression, standardise expression and restore the function of a diseased cell or tissue. The present sequence is one of the transcriptomes described in the exemplification of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ö
                                                       The present invention describes a method of identifying the type of cell in a sample, involving determining which of the sequences AAH63161-AAH64724 is expressed by the cell. The transcriptomes described in the invention are cell-type specific, cancer specific or ubiquitously expressed in humans. They can also be used to screen for drugs, reduce ancher specific gene expression, standardise expression and restore the function of a diseased cell or tissue. The present sequence is one of the transcriptomes described in the exemplification of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          New isolated polynucleotides, useful for identifying specific cell type, such as cancer cell, comprises transcriptomes expressed in particular cell types.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Human, transcriptome, gene expression pattern, cancer, drug screening, cancer diagnosis, cell specific gene expression, ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Human ubiquitously expressed transcriptome sequence SEQ ID NO: 547.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     .;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ö
                                                                                                                                                                                                                                                                                                                                                                                        The present invention describes a method of identifying the type of cell in a sample, involving determining which of the sequences AAH61161-AAH64724 is expressed by the cell The transcriptomes described in the invention are cell-type specific, cancer specific or ubiquitoualy expressed in humans. They can also be used to screen for drugs, reduce cancer specific gene expression, standardise expression and restore the function of a diseased cell or tissue. The present sequence is one of the transcriptomes described in the exemplification of the invention
                                                                                                                                                                                                                                                                                                                                   New isolated polynucleotides, useful for identifying specific cell type, such as cancer cell, comprises transcriptomes expressed in particular
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Primer for detecting PTGS polymorphisms by primer extension SEQ ID 150.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Human; prostaglandin-endoperoxide synthase 2; PTGS2; cyclooxygenase 2;

This invention relates to a polynucleotide sequence that is a polymorphic variant of the human prostaglandin-endoperoxide synthase 2 (PTGS2) gene also referred to as cyclooxygenase 2. The human PTGS2 gene sequence as cyclooxygenase 2. The human PTGS2 gene sequence APF80896 contains 27 single nucleotide polymorphisms (SNPs). AAF80896 and APF80897 represented human PTGS2 gene and coding sequence, and the PTGS2 gene sequence, and to care used to isolated and characterise the PTGS2 gene sequence, and to coate the positions of the SNPs. PTGS2 proteins and polynucleotide are used to express variant PTGS2 proteins for structural analysis or drug-binding studies and also in gene therapy (either expressing PTGS2 or inhibitory RNA). Antibodies raised against PTGS2 are useful for diagnosis, prognosis and therapy and analysis of the new, and known, polymorphisms and used to determine PTGS2 haplotype and genotype, especially for determining association between a particular trait, e.g. a clinical response to drugs that target PTGS2 but also disease clinical response to drugs that target PTGS2 but also disease sustend for instance in the particular trait of the sevent and se
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        used for developing diagnostic tests and treatments for immune-related disorders such as arthritis and inflammation. The polymorphisms may also be used to study expression and biological function of PTGS2. Transgenic

The present invention describes an isolated DNA molecule comprising a coding sequence of a yeast gene selected from a group of 745 NORF (not previously assigned oppon reading frame; or nonannotated ORF) genes comprising a sAGE (serial analysis of gene expression) tag. Also described are: (1) a method (M1) of using NORF genes to affect the cell cycle comprising administering a NORF gene whose expression varies by at clast 10% between any two phases of the cell cycle selected from log phase, S phase and G2/M; (2) a method (M2) for screening candidate on any two phases of the cell cycle selected from log cartists as in M1, where a test substance which modifies the expression of the yeast gene is a candidate antifungal drug; (3) a method (M3) for the yeast gene is a candidate antifungal drug; (3) a method (M3) for comprising contacting human DMA with a probe which comprises at least 10 contagous nucleotides of a NORF gene whose expression in a configuous nucleotides of a NORF gene whose expression in a configuous nucleotides of a NORF gene whose expression in a confict and offect on gene expression in a cut of and the yeast cell of comprising contacting a yeast cell of comprision in the yeast cell of comprision in the yeast cell of comprision in the yeast cell of the differentially expression is affected by the class of drugs. The NORF gene whose expression is affected by the class of drugs. The NORF gene whose cell cycle, the differentially expression in the yeast cell of phases of the cell cycle. The expression is affected as markers of phases of the cell cycle. The cepresent SAGE tags used in the exemplification of the present invention. AAF33262 to AAF33262 
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Yeast gene coding sequences comprising NORF genes with serial analysis of gene expression (SAGE) tags, useful for studying, monitoring and affecting phases of the cell cycle.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Б
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The present invention describes an isolated DNA molecule comprising a coding sequence of a yeast gene selected from a group of 745 NORF (not previously assigned oppen reading frame; or nonannotated ORF) genes comprising a saging (serial analysis of gene expression) tag. Also described are: (1) a method (M1) of using NORF gene whose expression varies by at least 10% between any two phases of the cell cycle selected from Log phase, S phase and G2/M; (2) a method (M2) for screening candidate and things landmainistering along sepression of a NORF gene whose expression cantifungal darge comprising; (a) contacting a test substance with a yeast cell; and (b) monitoring expression of a NORF gene whose expression of the yeast gene is a candidate antifungal drug; (3) a method (M3) for identifying human genes which are involved in cell cycle progression of a dontifying human genes which are involved in cell cycle progression contiguous nucleotides of a NORF gene whose expression varies as in M1; and (4) a method (M4) for identifying a candidate drug as a member of a class of drugs having a characteristic effect on gene expression in a class of drugs having a characteristic effect on gene expression in a comprising contacting a yeast cell of comprising ontexting a yeast cell with a candidate drug and monitor and affect phases of the cell cycle. The control of antiformal and affect phases of the cell cycle. The methods may be used to identify candidate drugs which affect the cell cycle. The methods may be used to identify candidate drugs which affect the call cycle. The cypression is affected as markers of phases of the cell cycle. The methods may be used to identify candidate drugs which affect the cell cycle. The cypressent SAGE tags used in the exemplification of the present invention.

The present invention describes an isolated DNA molecule comprising a coding sequence of a yeast gene selected from a group of 745 NORF (not previously assigned open reading frame, or nonannotated ORF) genes comprising a SAGE (serial analysis of gene expression) tag. Also described are: (1) a method (M1) of using NORF genes to affect the cell cycle comprising administering a NORF gene whose expression varies by at least 10% between any two phases of the cell cycle selected from log phase, S phase and G2/M; (2) a method (M2) for screening candidate cell; and (b) monitoring expression of a NORF gene whose expression of the yeast gene is a candidate antifungal drug; (3) a method (M3) for cell; and (b) monitoring expression of a NORF gene whose expression of the yeast gene is a candidate antifungal drug; (3) a method (M3) for comprising contecting human DNA with a probe which comprises at least 10 comprising contecting human DNA with a probe which comprises at least 10 comprising contecting human DNA with a probe which comprises at least 10 contiguous nucleotides of a NORF gene whose expression in a contiction expression in the yeast cell with a candidate drug and contecting a yeast cell with a candidate drug and contecting a peast cell with a candidate drug and contecting a yeast cell with a candidate drug and contecting a yeast cell with a candidate drug and contecting a yeast cell with a candidate drug and contecting a yeast cell of at least 1 NORF gene whose expression in the yeast cell of at least 1 NORF gene may be used to identify candidate drugs which affect the cell cycle and fect phases of the cell cycle and for identification of antifungal drugs. AAF33268 to AAF43367 represent linkers and PCR primers used in the sxemplification of the present invention.
                                                                                                                                                                                                      Yeast gene coding sequences comprising NORF genes with serial analysis of gene expression (SAGE) tags, useful for studying, monitoring and affecting phases of the cell cycle.

Yeast gene coding sequences comprising NORF genes with serial analysis of gene expression (SAGE) tags, useful for studying, monitoring and affecting phases of the cell cycle.

Example; Page 135; 419pp; English.

The present invention describes an isolated DNA molecule comprising a coding sequence of a yeast gene selected from a group of 745 NORF (not previoually assigned open reading frame; or nonaminotated ORF) genes comprising a SAGE (serial analysis of gene expression) tag. Also described are: (1) a method (M1) of using NORF genes to affect the cell cycle comprising administering a NORF gene whose expression varies by at least 10% between any two phases of the cell cycle selected from log phase, 8 phase and G2/M; (2) a method (M2) for screening candidate cantifungal drugs comprising: (a) contacting a test substance which severesion of the yeast gene is a candidate antifungal drug; (3) a method (M3) for it has yeast gene is a candidate antifungal drug; (3) a method (M3) for identifying human genes which are involved in cell cycle progression of comprising contacting human DNA with a probe which comprises at least 10 contacting use nucleotides of a NORF gene whose expression in a contiguous nucleotides of a NORF gene whose expression in a contiguous nucleotides of a NORF gene whose expression in a contiguous nucleotides of a NORF gene whose contiguous nucleotides of a NORF gene whose expression in a contiguous nucleotides of a NORF gene whose cut of a contacting expression in the yeast cell of at least 1 NORF gene may be used contacting a yeast cell of at least 1 NORF gene whose expression is affected by the class of the cell cycle, the differentially expression is a fleeted by the class of the cell cycle, the differentially expression and affect phases of the cell cycle, the differentially expressed genes may be used as markers of phases of the cell cycle. The content of antifungal drugs which affect the cell cycle and for identify candidate drugs which affect the cell cycle and for identify candidate drugs which affect the cell cycle and cycle and the call cycle and the call cycle and the call cycle and the call cycle and cycle and cycle and cycle and contacting expression in the cycle and cycle and cycle and cycle represent SAGE tags used in the exemplification of the present invention AAF33262 to AAF33267 represent linkers and PCR primers used in the SAGE method, in the exemplification of the present invention

The present invention describes an isolated DNA molecule comprising a coding sequence of a yeast gene selected from a group of 745 NORF (not previoually assigned open reading frame, or nonamnotated ORF) genes comprising a SAGE (serial analysis of gene expression) tag. Also described are: (1) a method (M1) of using NORF genes to affect the cell comprising administering a NORF gene whose expression varies by at least 10% between any two phases of the cell oycle selected from log phase, S phase and G2/M; (2) a method (M2) for screening candidate cell; and (b) monitoring expression of a NORF gene whose expression of the yeast gene is a candidate antifungal drug; (3) a method (M2) for screening candidate of the yeast gene is a candidate antifungal drug; (3) a method (M3) for identifying human genes which are involved in cell cycle progression of comprising contacting human DNA with a probe which comprises at least 10 contiguous nucleotides of a NORF gene whose expression in a class of drugs having a characteristic effect on gene expression in a contiguous nucleotides of a NORF gene whose expression is affected by the class of drugs. The NORF gene whose expression is affected by the class of the cell cycle, the differentially expression in the yeast cell of at least 1 NORF genes may be used to surface and for identification of the present invention. Cycle and for identification of antigual drugs which affect the cell cycle expression in the sample of the cell cycle the cell cycle. The methods may be used to identify candidate drugs which affect the cycle expression of antifungal drugs which affect the cell cycle and for identification of antigual prugas. April 267 the present invention. April 267 represent linkers and PCR primers used in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         AAF33262 to AAF33267 represent linkers and PCR primers to method, in the exemplification of the present invention

The present invention describes an isolated DNA molecule comprising a coding sequence of a yeast gene selected from a group of 745 NORF (not previously assigned open reading frame, or nonanotated ORP) genes comprising a SAGE (serial analysis of gene expression) tag. Also described are: (1) a method (M1) of using NORF genes to affect the cell cycle comprising administering; a NORF gene whose expression varies by at least 10% between any two phases of the cell cycle selected from log to antifungal drugs comprising: (a) contexting a test substance with a yeast cell; and (b) monitoring expression of a NORF gene whose expression of varies as in M1, where a test substance which modifies the expression of the yeast gene is a candidate antifungal drug; (3) a method (M2) for cell; and (b) monitoring expression of a NORF gene whose expression of the yeast genes whose expression of comprising contacting human DNA with a probe which comprises at least 10 comprising contacting human DNA with a probe which comprises at law in M; configuous nucleotides of a NORF gene whose expression in a confidite for a candidate drug as a member of a class of drugs having a characteristic effect on gene expression in a comprisming contexting a yeast cell with a candidate drug and monitoring expression in the yeast cell with a candidate drug and contoring expression in the yeast cell of at least 1 NORF gene whose expression is affected by the class of drugs. The NORF genes may be used to identify candidate drugs which affect the cell cycle the category monitor and affect phases of the cell cycle, the differentially cycle and for identification of antifungal drugs AAF3326 to AAF3326 to

The present invention describes an isolated DNA molecule comprising a coding sequence of a yeast gene selected from a group of 745 NORF (not previoually assigned open reading frame; or nonamontated ORF) genes comprising a SAGE (serial analysis of gene expression) tag. Also described are: (1) a method (M1) of using NORF genes to affect the cell cycle comprising administering a NORF gene whose expression varies by at least 10% between any two phases of the cell cycle selected from log phase, S phase and G2/M; (2) a method (M2) for screening candidate antifungal drugs comprising: (a) contacting a test substance which see expression of cell; and (b) monitoring expression of a NORF gene whose expression of the yeast gene is a candidate antifungal drug; (3) a method (M3) for identifying human genes which are involved in cell cycle progression of comprising contacting human DNA with a probe which comprises at least 10 contiguous nucleotides of a NORF gene whose expression in a method (M4) for identifying a candidate drug as a member of a class of drugs having a characteristic effect on gene expression in a contiguous nucleotides of a NORF gene whose expression is affected by the class of drugs. The NORF gene whose expression is affected by the class of the cell cycle, the differentially expression in the yeast cell of at least 1 NORF gene may be used to identify candidate drugs which affect the cell cycle and for identification of antifungal drugs. ARF33268 to AAF33267 represent in the exemplification of the present invention.

AAF33262 to AAF33267 represent linkers and PCR primers used in the SAGE method, in the exemplification of the present invention

The present invention describes an isolated DNA molecule comprising a coding sequence of a yeast gene selected from a group of 745 NORF (not previously assigned open reading frame; or nonamnotated ORF) genes comprising a SAGE (serial analysis of gene expression) tag. Also comprising administering a NORF gene expression varies by at cycle comprising administering a NORF gene whose expression varies by at cycle comprising administering a NORF gene whose expression or arises by at cycle comprising administering a NORF gene whose expression of phase, S phase and G2M; (2) a method (M2) for screening candidate confiturable and the monitoring expression of a NORF gene whose expression of the yeast gene is a candidate antifungal drug; (3) a method (M3) for identifying human genes which are involved in cell cycle progression configuous nucleotides of a NORF gene whose expression varies as in M1; comprising contacting human DNA with a probe which comprises at least 10 configuous nucleotides of a NORF gene whose expression in a configurate drug as a member of drugs having a characteristic effect on gene expression in a yeast cell comprising contacting a yeast cell of at least 1 NORF gene whose cypression is affected by the class of drugs. The NORF gene whose corpression is affected by the class of the cell cycle, the differentially cerpression is attendable as markers of phases of the cell cycle. The expression may be used to expressed genes may be used to expressed the cell cycle. The
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Yeast gene coding sequences comprising NORF genes with serial analysis of gene expression (SAGE) tags, useful for studying, monitoring and affecting phases of the cell cycle.
                                                                                                                                                                                                                  Yeast; Saccharomyces cerevisiae; characterisation; cell cycle; NORF; nor previously assigned open reading frame; nonannotated ORF; SAGE; serial analysis of gene expression; antifungal; tag; identification; linker; PCR primer; ds.

                                                                                                                                                                                                                                                                                                                                                                                                                                              21-DEC-2000
                                                                                          AAF33555;
RESULT 213
                        AAF33555
```

The present invention describes an isolated DNA molecule comprising a coding sequence of a yeast gene selected from a group of 745 NORF (not previously assigned open reading frame; or nonannotated ORF) genes comprising a SAGE (serial analysis of gene expression) tag. Also comprising administering a NORF gene whose expression varies by at cycle comprising administering a NORF gene whose expression varies by at chase, S phase and GZ/M; (2) a method (M2) for screening candidate antifungal drugs comprising: (a) contacting a test substance with a yeast call; and (b) monitoring expression of a NORF gene whose expression or varies as in M1, where a test substance which modifies the expression of the yeast gene is a candidate antifungal drug; (3) a method (M3) for identifying human genes which are involved in cell cycle progression comprising contacting human DNA with a probe which comprises at least 10 contiguous nucleotides of a NORF gene whose expression varies as in M1; and (b) for identifying a candidate drug as a member of a none of

class of drugs having a characteristic effect on gene expression in a yeast cell comprising contacting a yeast cell with a candidate drug and yeast cell comprising contacting a yeast cell with a candidate drug and monitoring expression in the yeast cell of at least 1 NORF gene whose expression is affected by the class of drugs. The NORF genes may be used to study, monitor and affect phases of the cell cycle, the differentially expressed genes may be used as markers of phases of the cell cycle. The methods may be used to identify candidate drugs which affect the cell cycle and for identification of antifungal drugs. AAPR3256 to AAF44064 represent SAGE tags used in the exemplification of the present invention.

The present invention describes an isolated DNA molecule comprising a coding sequence of a yeast gene selected from a group of 745 NORF (not previously assigned open reading frame; or nonannotated ORF) genes comprising a SAGE (serial analysis of using NORF genes to affect the cell comprising administering a NORF gene whose expression) tag. Also described are: (1) a method (M1) of using NORF genes to affect the cell cycle comprising administering a NORF gene whose expression varies by at least 10% between any two phases of the cell cycle selected from log phase, 5 phase and G2/M; (2) a method (M2) for screening candidate antifungal drugs comprising: (a) contacting a test substance with a yeast cell; and (b) monitoring expression of the yeast gene is a candidate antifungal drug; (3) a method (M3) for identifying human genes which are involved in cell cycle progression comprising contacting human DNA with a probe which comprises at least 10 contiguous nucleotides of a NORF gene whose expression varies as in M1; and (4) a method (M3) for identifying a candidate drug as a member of a class of drugs having a characteristic effect on gene expression in a yeast cell with a candidate drug and a contiguend contacting a yeast cell with a candidate drug and a contiguend contacting a yeast cell with a candidate drug and member of a class of drugs having contacting a yeast cell with a candidate drug and member of monitoring expression in the yeast cell of at least 1 NORF gene whose
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Yeast gene coding sequences comprising NORF genes with serial analysis of gene expression (SAGE) tags, useful for studying, monitoring and affecting phases of the cell cycle.
methods may be used to identify candidate drugs which affect the cell cycle and for identification of antifungal drugs. AAF33268 to AAF44064 represent SAGE tags used in the exemplification of the present invention. AAF33262 to AAF33267 represent linkers and PCR primers used in the SAGE method, in the exemplification of the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Yeast; Saccharomyces cerevisiae; characterisation; cell cycle; NORF;

The present invention describes an isolated DNA molecule comprising a coding sequence of a yeast gene selected from a group of 745 NORF (not previously assigned oppen reading frame; or nonannotated ORF) genes comprising a SAGE (serial analysis of gene expression) tag. Also described are: (1) a method (M1) of using NORF genes to affect the cell cycle comprising administering a NORF gene whose expression varies by at least 10% between any two phases of the cell cycle selected from log phase, S phase and G2/M; (2) a method (M2) for screening candidate antifungal drugs comprising: (a) contacting a test substance with a yeast antifungal drugs comprising: (a) contacting a test substance with a yeast cell in and (b) monitoring expression of a NORF gene whose expression of the yeast gene is a candidate antifungal drug; (3) a method (M3) for identifying human genes which are involved in cell cycle progression comprising contacting human DNA with a probe which comprises at least 10 contiguous nucleotides of a NORF gene whose expression varies as in M1; and (4) a method (M4) for identifying a candidate drug as a member of a

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Yeast gene coding sequences comprising NORF genes with serial analysis of gene expression (SAGE) tags, useful for studying, monitoring and affecting phases of the cell cycle.
expression is affected by the class of drugs. The NORF genes may be used to study, monitor and affect phases of the cell cycle, the differentially expressed genes may be used as markers of phases of the cell cycle. The methods may be used to identify candidate drugs which affect the cell cycle and for identification of antifundal drugs. AAP33268 to AAP44064 represent SABE tags used in the exemplification of the present invention AAF33262 to AAF33267 represent linkers and PCR primers used in the SAGE.

class of drugs having a characteristic effect on gene expression in a yeast cell comprising contacting a yeast cell with a candidate drug and monitoring expression in the yeast cell of at least 1 NORF gene whose expression is affected by the class of drugs. The NORF genes may be used to study, monitor and affect phases of the cell cycle, the differentially expressed genes may be used as markers of phases of the cell cycle. The methods may be used to identify candidate drugs which affect the cell cycle and for identification of antifungal drugs. AAF33268 to AAF4064 represent inherers and PCR primers used in the SAGE method, in the exemplification of the present invention.

Yeast gene coding sequences comprising NORF genes with serial analysis of gene expression (SAGE) tags, useful for studying, monitoring and affecting phases of the cell cycle.

Example; Page 350; 419pp; English.

The present invention describes an isolated DNA molecule comprising a coding sequence of a yeast gene selected from a group of 745 NORF (not previously assigned open reading frame; or nonamnotated ORF) genes comprising a SAGE (serial analysis of gene expression) tag. Also described are: (1) a method (M1) of using NORF genes to affect the cell cycle comprising administering a NORF gene whose expression varies by at plast 10% between any two phases of the cell cycle selected from log phase, S phase and G2/M; (2) a method (M2) for screening candidate antifungal drugs comprising: (a) contacting a test substance with a yeast cell; and (b) monitoring expression of a NORF gene whose expression varies as in M1, where a test substance which modifies the expression of the yeast gene is a candidate antifungal drug; (3) a method (M3) for identifying human genes which are involved in cell cycle progression

```
comprising contacting human DNA with a probe which comprises at least 10 contiguous nucleotides of a NORF gene whose expression varies as in M1; and (4) a method (M4) for identifying a candidate drug as a member of a class of drugs having a characteristic effect on gene expression in a yeast cell comprising contacting a yeast cell with a candidate drug and monitoring expression in the yeast cell of at least 1 NORF gene whose expression is affected by the class of drugs. The NORF genes may be used to the cell cycle, the differentially expressed genes may be used as markers of phases of the cell cycle. The methods may be used to identify candidate drugs which affect the cell cycle and for identification of antifungal drugs. AAP33268 to AAF44064

Yeast gene coding sequences comprising NORF genes with serial analysis of gene expression (SAGE) tags, useful for studying, monitoring and affecting phases of the cell cycle.

Example; Page 369; 419pp; English.

The present invention describes an isolated DNA molecule comprising a coding sequence of a yeast gene selected from a group of 745 NORF (not previously assigned open reading frame; or nonannotated ONF) genes comprising a SAGE (serial analysis of gene expression) tag. Also described are: (1) a method (M1) of using NORF gene to affect the cell east 10% between any two phases of the cell cycle selected from log phase, S phase and G2/M; (2) a method (M2) for screening candidate antifungal drugs comprising: (a) contacting a test substance with a yeast cell; and (b) monitoring expression of a NORF gene whose expression

```
the yeast gene is a candidate antifungal drug; (3) a method (M3) for identifying human genes which are involved in cell cycle progression comprising contacting human DNA with a probe which comprises at least 10 comprising contacting human DNA with a probe which comprises at least 10 contiguous nucleotides of a NORF gene whose expression varies as in M1; or identifying a candidate drug as a member of a class of drugs having a characteristic effect on gene expression in a yeast cell comprising contacting a yeast cell with a candidate drug and monitoring expression in the yeast cell of at least 1 NORF gene whose expression is affected by the class of drugs. The NORF genes may be used captressed genes may be used to identify candidate drugs which affect the cell cycle. The methods may be used to identify candidate drugs which affect the cell cycle and for identification of antifungal drugs. AAP33268 to AAF44064 represent SAGE tags used in the exemplification of the present invention. AAF33262 to AAF33267 represent linkers and PCR primers used in the SAGE method, in the exemplification of the present invention.

Yeast gene coding sequences comprising NORF genes with serial analysis of gene expression (SAGE) tags, useful for studying, monitoring and affecting phases of the cell cycle.

Example; Page 51; 419pp; English.

The present invention describes an isolated DNA molecule comprising a coding sequence of a yeast gene selected from a group of 745 NORF (not previously assigned open reading frame; or nonannotated ORF) genes comprising a SAGE (serial analysis of gene expression) tag. Also described are: (1) a method (M1) of using NORF genes to affect the cell cycle comprising administering a NORF gene whose expression varies by at least 10% between any two phases of the cell cycle selected from log

phase, S phase and G2/M; (2) a method (W2) for screening candidate
antifungal drugs comprising: (a) contacting a test substance with a yeast
cell; and (b) monitoring expression of a NORF gene whose expression
varies as in M1, where a test substance which modifies the expression of
the yeast gene is a candidate antifungal drug; (3) a method (M3) for
the yeast gene is a candidate antifungal drug; (3) a method (M3) for
comprising contacting human DNA with a probe which comprises at least 10
contiguous nucleotides of a NORF gene whose expression varies as in M1;
and (4) a method (M4) for identifying a candidate drug as a member of a
class of drugs having a characteristic effect on gene expression in a
yeast cell comprising contacting a yeast cell with a candidate drug and
monitoring expression in the yeast cell of at least 1 NORF genes whose
contudy, monitor and affect phases of the cell cycle. The
cyclessed genes may be used as markers of phases of the cell cycle. The
cycle and for identification of antifungal drugs which affect the cell
cycle and for identification of antifungal drugs. AAF33268 to AAF44064

Yeast gene coding sequences comprising NORF genes with serial analysis of gene expression (SACE) tags, useful for studying, monitoring and affecting phases of the cell cycle.

Example; Page 85; 419pp; English

The present invention describes an isolated DNA molecule comprising a coding sequence of a yeast gene selected from a group of 745 NORF (not previously assigned open reading frame; or nonannotated ORF) genes comprising a SAGE (serial analysis of gene expression) tag. Also described are: (1) a method (M1) of using NORF genes to affect the cell cycle comprising administering a NORF gene whose expression varies by at least 10% between any two phases of the cell cycle selected from log phase, 5 phase and G2/M; (2) a method (M2) for screening candidate antifungal drugs comprising: (a) contacting a test substance with a yeast cell; and (b) monitoring expression of a NORF gene whose expression of the yeast gene is a candidate antifungal drug; (3) a method (M3) for identifying human genes which are involved in cell cycle progression comprising contacting when a NORF gene whose expression of a dentifying human DNA with a probe which comprises at least 10 contiguous nucleotides of a NORF gene whose expression varies as in M1; a method (M4) for identifying a canacteristic effect on gene expression in a yeast cell comprising contacting a yeast cell with a candidate drug and monitoring expression in the yeast cell with a candidate drug and monitoring expression in the yeast cell with a candidate drug and monitoring expression in the yeast cell with a candidate drug and expression is affected by the class of drugs. The NORF genes may be used to identify candidate drugs which affect the cell cycle and for identification of antifungal drugs. Apr3268 to AAF44064 represent SAGE tags used in the exemplification of the present invention. method, in the exemplification of the present invention

The invention relates to a polynucleotide (I) comprising, or consisting of, apo-dystrophin-4 inversion sequence appearing as ABK86496, or its functional equivalents (e.g. the apo-dystrophin-4 cDNA sequence appearing tax ABK86497). Also included are polynucleotides that hybridise to either strand of (I), a vector containing (I), a cell containing (I) or the vector, proteins and peptides encoded by (I), a protein homologous with human dystrophin that is expressed on cell surfaces in vivo antibodies (Ab) specific for the protein and method of screening for leukemia cells (II) analysing DNA for presence of (I) or by detecting presence of (II). The apo-dystrophin-4 inversion and translation) of associated DNA, controls expression (transcription and translation) of associated DNA, and may allow read-through of stop codons. The apo-dystrophin-4 inversion sequence is used in gene therapy of diseases associated with truncation of proteins, particularly muscular dystrophy and also leukaemia, but more of proteins, particularly sequence used to control expression of any attached gene. Analysis of DNA for (I), or detection of proteins (II) can be used to screen for leukaemic cells and related diseases Antibodies raised against (II) can be used therapeutically, to inhibit (II) activity, also to detect (II) in screening assays. The inhibit (III) activity, also to detect (III) in screening assays. The direction trepeat thought to be responsible for the inversion present in apo-dystrophin-therapy.
                                                                                                                                                                                                                                                        New human regulatory polynucleotide, useful for treating disorders associated with protein truncation, particularly muscular dystrophy, and related peptides and antibodies.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The invention relates to a polymucleotide (I) comprising, or consisting of, apo-dystrophin-4 inversion sequence appearing as ABK86496, or its functional equivalents (e.g. the apo-dystrophin-4 cDNA sequence appearing as ABK86497). Also included are polymucleotides that hybridise to either strand of (I), a vector containing (I), a cell containing (I) or the cetor, proteins and peptides encoded by (I), a protein homologous with human dystrophin that is expressed on cell surfaces in vivo antibodies (Ab) specific for the protein and method of screening for leukemia cells by analysing DNA for presence of (I) or by detecting presence of (II). The apo-dystrophin-4 inversion sequence is a regulatory element that controls expression (transcription and translation) of associated DNA, and may allow read-through of stop codons. The apo-dystrophin-4 inversion sequence is used in gene therapy of diseases associated with truncation sequence is used in gene therapy of diseases associated with truncation of proteins, particularly muscular dystrophy and also leukaemia, but more of proteins, particularly muscular dystrophy and also leukaemia, but more attached gene. Analysis of DNA for (I), or detection of proteins (II) canceded by (I), can be used to screen for leukaemic cells and related diseases Antibodies raised against (II) can be used therapeutically, (I); and the second of the proteins of the second of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ;

New nucleic acids involved in neuronal regeneration, useful in screening for modulators of regeneration or synaptic efficiency, and potential
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The invention relates to nucleic acids (ABL98957-ABL99004) involved in regenerative neuronal processes and encoded proteins (ABB79405-ABB79409) used to screen for compounds and potential therapeutic agents that modulate nerve cell regeneration and/or synaptic efficiency. They may also be used for treatment or diagnosis of defective or pathological memory and learning conditions. The present sequence is that of an EST isolated from serial analysis of gene expression (SAGE) experiments comparing gene expression in the hippocampus of GFAF/L1 transgenic mice versus a wildtype control. The resultant EST were used to isolate the

Isolated human pyridoxal (pyridoxine, vitamin B6) kinase polyNts, useful for therapeutic purposes, for studying the expression and function of the polyNt, and for expressing pyridoxal protein.

Claim 19; Page 14; 135pp; English

The invention describes an isolated human pyridoxal (pyridoxine, vitamin E6) kinase, (PDXK) polymucleotide. The polymucleotide is useful in strong the expression and function of PDXK, and in expressing PDXK classes and for therapeutic purposes. A transgenic animal is useful for studying expression of the PDXK isogenes in vivo, for in vivo screening can destring of drugs targeted against PDXK procein, and for testing the efficacy of therapeutic against PDXK procein, and for testing the efficacy of therapeutic against PDXK procein, and for testing the candidate drugs targeted against PDXK and the blinding affinity of candidate drugs targeting PDXK for the treatment of autoimmune polyglandular disease type 1. The polypeptide is useful for studying is useful for candidate drugs targeting PDXK for the treatment of autoimmune colyglandular disease type 1. Genotyping and haplotyping is useful for improving the efficacy and reliability of several steps in the discovery and development of drugs for treating diseases associated with PDXK cativity, e.g., autoimmune polyglandular disease type 1, to validate PDXK as a candidate agent for treating a specific condition or disease colinical trials of candidate drugs. This sequence is one of 38 (see ABX16978-ABK17015) primers used for detecting PDXK gene polymorphisms by primer extension terminates, described in the method of the invention

Genotyping a human UDP glycosyltransferase 1 gene of an individual for determining the haplotype of an individual, involves determining the identity of a nucleotide pair at specific polymorphic sites for two copies of the gene.

The invention relates to genotyping a human UDP glycosyltransferase

(UGTIA1) gene of an individual, involving determining for the two copies

CC (UGTIA1) gene present in the individual, the identity of the

cuclectide pair at one or more polymorphic sites. The new method is

cuseful for determining whether an individual has a haplotype or haplotype

cuseful for determining whether an individual has a haplotype or haplotype

cc pairs, given in the specification. It is useful for improving the

cefficacy and reliability of several steps in the discovery and

cefficacy and reliability of several steps in the discovery and

cefficacy and reliability of several steps in the discovery and

continue, e.g., Gilbert's syndrome and Crigler-Najiar syndrome, to

validate UGTIA1 as a candidate agent for treating a specific condition or

disease predicted to be associated with UGTIA1 activity.

cc design of clinical trials of candidate drugs for treating a specific

cc condition or disease predicted to be associated with UGTIA1 activity. The

method is useful to screen for compounds targeting UGTIA1 to treat a

cc specific condition or disease associated with UGTIA1 activity. A nucleic

cc condition or disease suscoiated with UGTIA1 activity. A nucleic

cc specific condition of disease associated with UGTIA1 protein for

custing en or cDNA (II) or its fragment is useful in studying the

cc expression and function of UGTIA1, and in expressing uGTIA1 protein of useful for therapeutic purposes (II) or a

cuse in screening for candidate drugs to treat diseases related to UGTIA1

cc expension and function of ugTIA1, and in expressing of

cc therapeutic agents and compounds for clinbert's syndrome, in a biological system. Associated

Human activated Th1 and Th2 cell expression gene group, useful for the diagnosis and treatment of Th1 and Th2-related diseases.

```
The invention relates to SAGE (serial analysis of gene expression) tags representing groups of genes which are expressed in activated human Thi and/or Th2 cells. The SAGE tags of this invention consist of a sequence of 10 nucleotides located downstream of the 5'-CATG-3' sequence motification in case to the polya region of cDNAs derived from a variety of genes. These tags serve to uniquely identify each transcript and can thus be used to analyse the pattern of gene expression in particular cell types. The invention also relates to proteins encoded by the genes capressed in Thi and/or Th2 cells, antibodies against these proteins, and inhibitors of the expression of groups of genes that are expressed in cither or both the two cell types. Groups of genes expressed in Thi and of Th2 cells and for the diagnosis and treatment of Th1 and Th2-related disorders. Sequences ABV78390-ABV78560 are SAGE tags representing 171 genes which are more highly expressed in Th1 cells compared with Th2 cells
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 SAGE tag; serial analysis of gene expression; human; chronic hepatitis C; CH; liver tissue; hepatocellular carcinoma; cancer; tumour; HCC; expression pattern; differential expression; EST; expressed sequence tag;

ö
relates to proteins encoded by the genes expressed in chronic hepatitis C liver tissue or HCC, antibodies against these proteins, and inhibitors of the expression of groups of genes that are overexpressed in chronic hepatitis C liver tissue or HCC. Groups of genes differentially expressed in chronic hepatitis C tissue or HCC may be used for the diagnosis and treatment of these diseases. Such agenes, inhibitors of their expression or activity, and antibodies against the gene products may be used in the development of drugs to treat chronic hepatitis C and/or HCC. Sequences ABV84191-ABV84290 are SAGE tags representing the 100 most highly expressed genes out of those genes which are overexpressed in chronic hepatitis C liver tissue compared with normal liver tissue
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           SAGE tag; serial analysis of gene expression; human; chronic hepatitis C; CH; liver tissue; hepatocellular carcinoma; cancer; tumour; HCC; expression pattern; differential expression; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       liver tissue or HCC, antibodies against these proteins, and inhibitors of the expression of groups of genes that are overexpressed in chronic hepatitis C liver tissue or HCC. Groups of genes differentially expressed in chronic hepatitis C tissue or HCC may be used for the diagnosis and treatment of these diseases. Such genes, inhibitors of their expression or activity, and antibodies against the gene products may be used in the development of drugs to treat chronic hepatitis C and/or HCC. Sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The invention relates to SAGE (serial analysis of gene expression) tags representing groups of genes which are differentially expressed in human chronic hepatitis C (CH) liver tissue or hepatitis C-induced hepatocellular carcinoma (HCC) compared with normal human liver tissue. The SAGE tags of this invention consist of a sequence of 10 nucleotides located downstream of the 5'-CATG-3' sequence motif lying nearest to the polya region of cDNAs derived from a variety of genes. These tags serve to uniquely identify each transcript and can thus be used to analyse the pattern of gene expression in particular cell types. The invention also relates to proteins encoded by the genes expressed in chronic hepatitis C
                                                                                                                                                                                                                                                                                                                                                                   Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Human chronic hepatitis C tissue expression exasperating gene group comprises 100 high-ranking genes.

The invention relates to SAGE (serial analysis of gene expression) tags representing groups of genes which are differentially expressed in human chronic hepatitis C (GM) liver tissue or hepatitis C-induced hepatocellular carcinoma (HCC) compared with normal human liver tissue. The SAGE tags of this invention consist of a sequence of 10 nucleotides located downstream of the 5'-CATG-3' sequence motif lying nearest to the polya region of cDNAs derived from a variety of genes. These tags serve to uniquely identify each transcript and can thus be used to analyse the pattern of gene expression in particular cell types. The invention also

Human chronic hepatitis C tissue expression exasperating gene group comprises 100 high-ranking genes.

These myc target or tag sequences are identified by SAGE (serial analysis of gene expression). The library is useful to find new diagnoses and treatments for cancer. The invention is also useful to enhance production of recombinant proteins in a production system with high expression of endogenous or transfected myc oncogenes. ABK23412-ABK23828 represent transcript tag DNA sequences that are activated or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        A new nucleic acid library of myc-dependent downstream genes capable of supporting a neoplastic characteristic of cancer is useful to find new therapies and diagnoses for cancer.
ABV84691-ABV84790 are SAGE tags representing the 100 least highly expressed genes out of those genes which are underexpressed in hepatocellular carcinoma compared with chronic hepatitis C liver tissue
                                                                                                                                                                                                                                                                                                                                                                                                                                               Myc-dependent downstream gene; neoplastic; cancer; growth; invasion; spread; myc target; myc tag; SAGE; serial analysis of gene expression; myc oncogene; N-myc; human neuroblastoma; cytostatic; ds.

                                                                                                                                                                                                                                                                                                                                                                                        The invention describes an isolated polynucleotide sequence comprising a paraxonase 2 (PON2) isogene. Primers and probes allow identification of this sequence and its polymorphisms and are useful for identifying which isoform of paraxonase 2 a person carries. Identification of a PON2 isoform allows tailored pharmaceutical treatment to be designed and administered. PON2 is a particularly important gene for the treatment of coronary heart disease. This sequence represents a primer extension oligonucleotide used for detecting PON2 gene polymorphisms, described in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Human CHRMS gene polymorphism detection oligonucleotide primer #3.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ;

The present invention relates to a new cholinesgic receptor, muscalinic so variant for a reference sequence for the CHRM5 gene or its fragment, or a polymorphic variant of a reference sequence for the CHRM5 gene or its fragment, or a polymorphic variant of a reference sequence for a CHRM5 cDNA or its fragment. The invention is useful in drug screening assays. The molecules of the invention are useful in drug screening assays. The molecules of the invention are useful in drug screening season and function of CHRM5, and in expressing CHRM5 protein for use in screening for candidate drugs to treat diseases related to CHRM5 activity. The methods of the invention are useful in developing diagnostic tests and therapeutic treatments. The method is also useful in the design of clinical trials of candidate drugs for treating specific condition or disease associated with CHRM5 activity and is useful in determining whether an individual has one of the haplotype pairs. The invention is useful in a variety of diagnostic and prognostic formats and therapeutic methods. The invention is also useful in genotyping and/or haplotyping the CHRM5 gene in an individual. The present nucleic acid sequence trepresents one of a collection of oligomorleotide primers (ABRE1795).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 present invention relates to a new cholinergic receptor, muscarinic 5
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   that were used in the invention to detect polymorphisms in the
                                                                                                                                                                                                                                                                                                                                            Novel cholinergic receptor, muscarinic 5 polynucleotide useful therapeutically and in screening for candidate drug to treat diseases related to the receptor activity.
                                                                                                                                                                                                                        Nandabalan K;

```

which is a polymorphic variant of a reference sequence for the human smoothened brosophila homologue (SWOH) gene or its fragment, or a smoothened brosophila homologue (SWOH) gene or its fragment, or a reference sequence for a SMOH cDNA or its fragment. Anew isolated polypeptide is useful for screening for drugs trageting the polypeptide. A new method is useful for identifying an association between a trait such as a clinical response to a drug targeting SMOH and a haplotype or haplotype pair of SMOH gene. The methods have applicability in developing diagnostic tests and therapeutic treatments for basal cell carcinomas (BCCs). The isolated polymucleotide is useful for studying the expression and function of SMOH and expressing SMOH protein for use in screening for candidate drugs to treat diseases related to SMOH activity. The polymorphism and haplotype data are useful for validating whether SMOH is a suitable target for drugs to treat BCCs, ascreening for the drugs and reducing bias in clinical trials of the drugs. The isolated polymucleotide is useful for therapeutic purposes. The new method, an oligonucleotide and kit of the invention are useful contermining whether an individual has one of the haplotypes or the contermining whether an individual has one of the haplotype or the

invention relates to an isolated polynucleotide comprising a sequence the is a polymorphic variant of a reference sequence for the human

Claim 17; Page 15; 179pp; English

New genetic variants of smoothened Drosophila homolog (SMOH) gene useful for therapeutic purposes and for expressing SMOH protein useful in identifying drugs to treat basal cell carcinomas.

The invention discloses a method for identifying a candidate polymorphic repeat within a coding sequence (expressed sequence tag, EST), which comprises detecting tandem repeats in a target coding sequence, scoring the repeats for polymorphic probability and generating a dataset correlating the repeats with polymorphic probability to identify a candidate polymorphic repeat. The computational methods (polymorphic marker prediction of ubiquitous simple sequences, POMPOUS, and Rep-X) are useful for identifying and detecting candidate polymorphic repeats in human genes, which can be used to understand, treat or aliminate genetic diseases, predispositions or adverse drug-treatment reactions. Examples
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     spinocerebellar ataxia. The sequences presented in ABX79676-ABX80022 are
the polymorphic repeats identified for a search of human ESTs
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    syndrome, Huntington's disease, fragile-X syndrome, Fredreich's ataxis, myotonic dystrophy, hyperandrogenaemia, spinal and bulbar atrophy and

The invention discloses a method for identifying a candidate polymorphic repeat within a coding sequence (expressed sequence tag, BST), which comprises detecting tandem repeats in a target coding sequence, scoring the repeats for polymorphic probability and generating a dataset correlating the repeats with polymorphic probability to identify a correlating the repeats with polymorphic probability to identify a marker prediction of ubiquitous simple sequences, POMPOUS, and Rep. X) are useful for identifying and detecting candidate polymorphic repeats in wham agenes, which can be used to understand, treat or eliminate genetic diseases, predispositions or adverse drug-treatment reactions. Examples of diseases linked to nucleotide repeats are Machado-Joseph, Haw River
                              Identifying a candidate polymorphic repeat within a coding sequence, for understanding or treating genetic disease, comprises detecting tandem repeats in a target coding sequence and scoring the repeats for polymorphic probability.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Detecting colorectal cancer in a subject, involves detecting macrophage inhibitory cytokine or renal dipeptidase or their mRNA in feces or blood of the subject.
                                                                                                                                                                                                                                                                                                                                                                syndrome, Huntington's disease, fragile-X syndrome, Fredreich's ataxis, myotonic dystrophy, hyperandrogenaemia, spinal and bulbar atrophy and spinocerebellar ataxia. The sequences presented in ABX79676-ABX80022 are the polymorphic repeats identified for a search of human ESTs

The invention relates to detecting CC (colorectal cancer e.g. colorectal adenoma), comprising: (a) detecting macrophage inhibitory cytokine (MIC) or comparising: (a) detecting macrophage inhibitory cytokine (MIC) or the passe (MDD) in faeces or blood of a subject and comparing elevated amount of MIC or RDP in the subject is an indicator of CC in subject; (b) isolating mRNA sample from faeces of a subject, detecting CC MIC or RDP mRNA in the mRNA sample, and comparing amount of MIC or RDP mRNA in the subject is an indicator of CC in subject; (c) isolating epithelial cells from blood of a subject, isolating amount of MIC or RDP mRNA in the mRNA sample, and comparing the subject or epithelial cells, detecting MIC or RDP mRNA in the mRNA sample, and comparing the amount of MIC or RDP mRNA in the mRNA sample to amounts of MIC or RDP mRNA in the subject; (d) contacting blood or faeces of a subject; (e) an elevated amount of MIC or RDP mRNA in the blood or faeces by CC in the subject; (d) contacting blood or faeces of a subject; (e) an elevated amount of activity of RDP in the blood or faeces by detection of increased reaction product or decreased RDP substrate, and comparing to a subject is an indicator of CC in the blood or faeces of the subject and comparing to a subject is an indicator of CC in the blood or faeces of the subject and cubject in the blood or faeces of the subject and comparing to a subject is an inhibitor of RDP, where the antibody which specifically care of localisation of the mubject from outside of the subject, where are of localisation of the molect within the subject but outside the proximal tubules of the kidney identifies CC; or (f) administering to a subject and detecting the molety isolating faeces or blood from the subject, where an electing in the faeces or blood sudicate CC; or (f) administering to a subject and detecting in the faeces or blood sudicate CC; or (f) administering to a subject and the detectable molety; isolating faeces or blood from the subject. The methods of the the dete
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             are useful for detecting colorectal cancer in a subject. The present sequence is a DNA tag derived from a human transcript whose expression is
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  repressed in colorectal cancer or colorectal adenoma

Zinc finger protein DNA-binding domain target sequence SEQ ID NO:250

Zinc finger domain; zinc finger; zinc finger binding domain; probe; chimeric nucleic acid; library; PCR primer; ss.

Synthetic.

Hwang M; Ryu E, Kwon Y, 17-AUG-2001; 2001US-0313402P. 22-APR-2002; 2002US-0374355P. 17-AUG-2002; 2002WO-KR001560 Park K, (TOOL-) TOOLGEN INC WO2003016571-A1. Bae K, 27-FEB-2003. Kim J,

                                                                                                                                                                                        polypeptide comprises a first or second zinc finger domain. The domining of each polypeptide are identical to a zinc finger domain from a naturally occurring protein and either do not occur in the same naturally occurring protein or occur in the same naturally occurring protein or occur in the ame naturally occurring protein or occur in the and naturally occurring protein in a different configuration than in the polypeptide. The domains vary among polypeptides. Also described: (1) producing chimaric nucleic acids; (2) generating an artificial zinc finger polypeptide that specifically binds to a target DNA site; and (3) identifying a nucleic acid encoding a zinc
                                                                                                                                                                        present invention describes a library comprising polypeptides. Each
                                                                                                                                                                                                                                                                                                                                                                      finger polypeptide that specifically recognises a target DNA site. The library can be used for producing chimeric nucleic acids. ACC41551 to ACC41758 and ABR40919 to ABR41015 represent nucleotide and amino acid
                                                            New library comprising polypeptides having zinc finger domains, useful for producing chimeric nucleic acids.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Gaps

New isolated polynucleotide useful for haplotyping and/or genotyping cholesteryl ester transfer protein (CETP) gene in an individual or in screening for drugs useful in treating diseases associated with CETP activity

Claim 45; SEQ ID NO 186; 250pp; English

The invention comprises the amino acid and coding sequences of the human

8888888888888

```
cholesteryl ester transfer protein (CETP), the invention also comprises polymorphisms identified within the CETP gene. The DNA and protein sequences of the invention are useful in haplotyping and/or genotyping the CETP gene in an individual. The DNA and protein sequences may also be used to screen drugs or compounds targeting the CETP or its variant to treat a condition or disease associated with CETP (e.g. atherosclerosis, cardiovascular disease or hypercholesterolaemia). The present DNA sequence represents an allele specific extension PCR primer for the human CETP gene.

compounds New human apical iodide transporter useful for screening of commable to modulate apical iodide transport in cells for treatment prevention or diagnosis of dysfunctional iodide transport. Disclosure; SEQ ID NO 43; 46pp; French

acids and antibodies against the protein, are useful for prevention, treatment (including gene therapy) of diseases that involve dysfunction of apical iodide transport, e.g. hypersecretion of thyroid hormone or development of thyroid tumours. The protein can also be used to countra accumulation of, or contamination by, radioactive iodine, and its peptide fragments are used to raise antibodies. The present sequence is used in the exemplification of the invention. The invention relates to a novel isolated, purified protein related to a apical iodide transporter protein. A protein of the invention has expressed; and antithyroid activity. A protein of the invention is used for screening of compounds able to modulate apical iodide transport in cells. The nucleic acid encoding the protein can be used for production of recombinant protein or to generate transgenic animals, useful in screening for agents that modulate activity of the protein. The protein, its peptides, nucleic acids encoding it, vectors containing the nucleic
